

Standards to agree with Meera

A small set of explicit rules, with a named restoration owner. These are proposals for sign-off, not existing contracts or implemented live controls.

Standard	Evaluable rule / threshold	Restoration owner
1. Reliable measurement	Login delay = End - Planned End; Logout = Start - Planned Start. Late means >15 min. Require four parseable timestamps, Login/Logout direction and nonnegative actual/planned durations. Missing/invalid = UNKNOWN. Exclude Login timing if either duration >720 min; retain the row. Production site reviews need approved site IDs.	Data steward repairs source/mapping; site lead verifies.
2. Early site review	For each site + O/S model over the previous 14 completed operating dates: review if eligible legs >=20, late legs >=5 and late share >=20%. Fewer than 20 eligible legs = LOW SAMPLE. Zero eligible legs = UNKNOWN.	O: site lead. S: account manager with client transport lead.
3. Actionable brief	By 10:00, each 08:00 review item has evidence, next action, owner, due time and approval state. Replacement requires authorised role, cab in approved pool, verified eligibility and quote <= signed cap. Any failed/missing check = APPROVAL_REQUIRED. Open past due = OVERDUE. Closure needs evidence/time; open handovers need incoming-owner acceptance by scheduled handover.	On-duty lead resolves missing owner/approval and overdue/handover gaps; named owner restores service.
4. Valid passenger capacity	Dispatch only if Employee Count is an integer >=0 and <= verified available passenger seats. Missing/unverified count or seats, negative/non-integer count or excess = HOLD assignment until sufficient capacity is verified. No capacity waiver.	Fleet controller verifies counts and restores eligible cover.
5. Live incident response	Active-duty heartbeat age must be 0-5 min. Missing/invalid/older = critical incident. Critical incidents require 0 <= acknowledgement time - creation time <=5 min; unacknowledged after 5 min escalates to the on-duty controller. A failed connection does not prove cab failure.	Shift controller checks contact, owns recovery and escalates unresolved cover.
6. Prevent expiry gaps	At 08:00, 0 < expiry - now <=30 days requires owner and renewal_due <= expiry by 10:00. Within 7 days, verify eligible cover for published duties ending after current validity. Missed renewal due escalates. Dispatch requires all policy-required documents verified through duty end; missing/expired = HOLD.	Compliance lead verifies renewal/eligibility; fleet controller restores eligible cover.
7. Accepted cover	At T-30 min, 100% of published legs due at T have eligible, accepted cab cover. Exclude only client cancellations logged by T-30; retain operator cancellations. Uncovered = critical; still uncovered at T-15 goes to city head. Acceptance is not physical readiness.	Fleet controller restores cover; city head owns unresolved escalation.
8. Comparable economics	Publish margin only with matched revenue/cost for every included leg on the same period/currency/basis. For each ledger: $\text{abs}(\text{allocation} - \text{ledger}) / \text{abs}(\text{ledger}) \leq 0.1\%$; zero ledger needs zero allocation. Missing inputs = UNAVAILABLE.	Finance analyst reconciles; vendor manager owns the commercial decision.

All clocks use IST; T = planned departure. Critical = invalid/missing/stale active-duty heartbeat, assigned-vehicle document/capacity HOLD, or uncovered leg at T-30. For S, the client operator owns dispatch/cover; the account manager coordinates. Names, authority limits and approved pools must be signed before live use. Demo: historical rules 1-2, local briefs/actions; live enforcement needs new feeds.

Make recovery less dependent on Meera

My aim is to help Meera run a more reliable operation with fewer avoidable escalations. I use the trip data to prioritise recurring problems, then propose clear decision authority, checks before affected shifts, and advance planning for document renewal and replacement vehicles. The working demo supports evidence review and action tracking. I would test the approach at three priority sites, measuring service reliability, unserved trips and Meera's workload before expanding it.

Initial focus: Northwind, IND-Hyderabad and Kestrel AQUILA account for 400/762 managed late legs (52.49%).

1. Give recovery owners clear decision authority

Give each manager a decision brief: facts/counterevidence, suggested step, owner/due, permitted action and escalation route. Proposed remit: account managers investigate, coordinate approved actions and give factual updates. O operations leads authorise eligible replacements within signed pool/cost limits. Missing cap, quote, pool or authority means approval required. S dispatch stays with the client operator. Promise/compensation changes go to the named approver. Meera must sign roles, backups and limits; the app grants no authority.

2. Put the check before the affected shift

An 08:00 review cannot protect a 03:00 departure. Use the historical queue for recurring improvement; use T-30/T-15 checks for immediate coverage. At IND, confirm the 03:00 promise, then observe cab-ready, boarding-complete and departure times over two comparable shifts. Here 65/66 departures are late, yet median arrival deviation is -4 min (departure +32 min). Fix the evidenced stage; do not assume a cab shortage.

3. Resolve expiry risk while recovery is still possible

Review expiries alongside the roster: propose a 30-day renewal lookahead and eligible cover at 7 days for affected duties. Compliance owns renewal; the fleet controller owns cover. Validate these horizons against renewal lead times. Document and spare registers are absent; no eligibility waiver is proposed.

Where to test the first service change

Northwind: 17:00 Login arrivals are 59/185 late. Check route-time allowance, pickup/departure and arrival evidence against the client promise. **Kestrel AQUILA:** Login is 49/132 late; 12:15 contributes 17/56 and 11:15 contributes 14/25. Select one evidence-supported shift correction, keep the promise fixed, and compare similar trips. No driver/vendor cause is established.

What works today; what I deferred

Built: adjustable O/S queues, source evidence, a selectable decision brief, local actions, closure evidence and backup/restore. Authority and live handover/checks remain proposals. Deferred: prediction/offline alerts need telemetry; finance ranking needs costs/revenue; compliance/dispatch automation needs documents, roster and accepted demand. Those feeds are absent. I have not inferred vendor fault or savings.

Test the result, including Meera's workload

Four-week targets after a fresh baseline: 20% relative reduction in pilot late share; historical 31.82% would imply 25.46%, not a forecast. Also target 25% fewer routine recovery cases needing the city head to decide per 100 operated legs; report her escalation minutes and incident volume alongside it. By week two, $\geq 95\%$ of the morning review list has owner/action/due by 10:00. Target unserved published-leg share and operator-cancellation share no higher than baseline (rule 7 population), and zero known-ineligible dispatches. Freeze routine-case classifications and client promises; log plan changes and compare similar non-pilot groups where feasible. These targets need new workflow/coverage records.

Basis: July 5-18, 2026; 5,581 legs retained, two suspect Login timing exclusions. Managed O = 762/4,154 late (18.34%). Login uses arrival; Logout uses departure. >15 min is a proposed plan-adherence proxy, not a verified SLA. Site labels are provisional; 955 rows remain unresolved. Process proposals are hypotheses to test, not proven savings.
